

LPG cylinders for the 21st century Supplied by AtlasLogistics Nigeria Limited.

An increasing number of gas companies around the world are introducing Ragasco's lightweight and transparent composite LPG cylinders to their customers. Feedback from the users is overwhelmingly positive, resulting in improved customer loyalty and ultimately increased profitability for the gas companies.

User benefits

Lightweight

Compared with traditional LPG cylinders, the tare weight is typically reduced by 50%. This is highly appreciated by customers that have to get their cylinder filled or exchanged.

Transparency

Being able to see through the wall enables the customer to monitor the gas level at any time, removing the risk of running out of gas unexpectedly. It will also handle the issue of under filling, ensuring that customers get the exact volume they are paying for.

Attractive appearance

Ragasco's award winning design has proved to be very attractive to end-users both for outdoor appliances as well as for indoor usage. Only non-corrosive materials are used and so the cylinder will not lose this attractiveness over time.

Product safety

In the approval process the cylinder has gone through an extensive test programme.

Some of the tests are: Fire, Drop, Cycling, High temperature creep, Shotgun, Flawed cylinder with cuts in the wall and Permeability.

The cylinders have successfully met all necessary criteria.

Impact protection

The valve is fully protected against impact damage.

UV-protection

To prevent degrading over time from changing weather condition, special additives are included in the materials.
